

PredictGuard

Risk diagnosis, wallet-signed Predict hedging, on-chain manager readback, and reportable lifecycle evidence for PLPs and vault builders.

4-minute demo companion deck

DeepBook Predict needs a risk layer before serious dUSDC capital allocates.

Binary options and PLP liquidity can be powerful, but LPs need tail-risk visibility, hedge cost, execution evidence, and settlement accounting.

- A generic market dashboard does not answer PLP downside exposure.
- Hedge recommendations need side, strike, expiry, notional, cost, and assumptions.
- Wallet execution must be real Sui PTB signing, not a mocked button.
- After minting, users need manager readback and lifecycle status.

A single workflow from simulated PLP risk to reportable on-chain evidence.

PredictGuard is deliberately workflow-first: it turns protocol integration into an understandable capital-allocation decision path.

The demo makes PLP tail risk legible before any wallet action.

- PLP overview summarizes max payout liability, available liquidity, and tail loss.
- Exposure and IV heatmaps show where risk concentrates by strike and expiry.
- Scenario simulator compares unhedged and hedged PnL under tail moves.
- Recommendation includes protection tradeoffs instead of hiding cost.

PredictGuard signed a real small Predict mint with Slush wallet on Sui testnet.

MANAGER/ACCOUNT SUMMARY
1 active position · 1.955293 dUSDC remaining
MarketKey decoded via Sui gRPC

Lifecycle status: active hedge coverage · redeem evidence pending · settlement accounting explicit

The mint was confirmed with digest 61A8wjnTkdjxTsonobvDzmQcnQ5eXwF2hTKZ9V7JT6Sx.

The product does not stop at "transaction submitted."

It reads manager state back from Sui, decodes MarketKey, and classifies the hedge lifecycle.

Manager `0x6ad31bd894103c...0fc1ce43f`

1

ON-CHAIN POSITION
Active hedge coverage.

1.955293

MANAGER DUSDC REMAINING
Direct manager readback.

0

REDEEMED LINKED
No redeemed evidence loaded.

UNCLAIMED PAYOUT
Kept explicit until chain evidence proves it.

Compact UI, real protocol integration underneath.

Sui Transaction PTB

Builds a real Transaction instance and hands it to dAppKit signAndExecuteTransaction.

Predict mint events

Parses PositionMinted into digest, manager, oracle, side, strike, quantity, cost, and ask price.

Quote-aware sizing

Uses latest successful ask evidence with budget buffer, while labeling limits honestly.

Manager readback

Reads PredictManager object and dynamic-field tables directly through Sui gRPC.

MarketKey decoding

Decodes oracle ID, expiry, strike, direction, and readable YES/NO position identity.

Settlement evidence

Tracks active, expired, zero quantity, redeemed, missing evidence, and realized PnL scope.

PredictGuard can become the risk layer for DeepBook Predict capital allocators.

Production indexer

Full manager mint, redeem, supply, withdrawal, and PLP history.

Portfolio risk

Multi-manager, multi-account exposure, alerts, and saved reports.

Automation

Keeper monitoring, redeem automation, and hedge policy approval controls.

The competition MVP proves the loop: risk diagnosis, wallet-signed hedge, chain readback, lifecycle accounting, and a judge-readable report.
